

Wine Quality Analysis

This report provides an analysis of the Wine Quality dataset. The dataset is divided into two parts: red wine and white wine.

1. Load the Dataset

We began by loading the datasets for red and white wine.

2. Data Cleaning and Preparation

After loading the data, we examined it for any missing values, outliers, or inconsistencies and handled them accordingly. Both the red and white wine datasets did not have any missing values.

3. Data Exploration

Using visualizations and statistics, we got a sense of the data's distributions, relationships, and potential patterns.

3.1 Distribution of Wine Quality Scores

The majority of wines (both red and white) have quality scores between 5 and 6. Few wines have scores of 3, 8, or 9.

3.2 Relationships Between Features and Wine Quality

We visualized the distributions of various features to get a sense of their spread and potential outliers.

4

Furthermore, we investigated the relationships between features and wine quality using correlation matrices and visualizations.

3.3 Important Factors Influencing Wine Quality

Alcohol, volatile acidity, and sulphates are among the most influential factors determining wine quality for red wines. This was derived using a Random Forest regressor to extract feature importances.
